

****Introduction to Display Variables****

=====

In this video, we will discuss display variables, a fundamental concept in Java programming. Display variables are used to print output to the screen.

****What are Display Variables?****

Display variables are not a new concept in Java, but rather a different way of presenting variables. The main goal is to understand how to work with variables and print output to the screen.

****Printing Output****

To print output, we use the `System.out.println()` method. This method can be used to print any type of variable, including strings, integers, and more.

****Combining Text and Variables****

To combine text and variables, we use the `+` operator. This operator has two meanings:

- * For text strings, it concatenates the strings together.
- * For numbers, it adds the values together.

****Example: Combining Text and Variables****

```
```java
String name = "Maharuf";
int age = 24;
System.out.println("Name and Age: " + name + " " + age);
```
```

****Example: Adding Numbers****

```
```java
int x = 10;
int y = 20;
System.out.println("The sum of x and y is: " + x + y);
```
```

However, if we remove the parentheses, the output will be different:

```
```java
int x = 10;
int y = 20;
System.out.println("The sum of x and y is: " + x + y);
```
```

In this case, the output will be "The sum of x and y is: 1020", not 30. This is because the ``+`` operator is concatenating the strings, not adding the numbers.

****Important Points****

- * Use parentheses to ensure correct order of operations.
- * Be careful when combining text and numbers.
- * Use the ``+`` operator to concatenate strings and add numbers.

****Key Takeaways****

- * Display variables are used to print output to the screen.
- * The ``System.out.println()`` method is used to print output.
- * The ``+`` operator is used to combine text and variables.
- * Be careful when combining text and numbers to avoid incorrect output.

****Conclusion****

In this video, we learned about display variables and how to use them to print output to the screen. We also discussed the importance of using parentheses and being careful when combining text and numbers. With practice and experience, you will become more comfortable working with display variables and creating your own Java programs.
