

Introduction to Display Variables

=====

In this video, we will discuss display variables, a fundamental concept in Java programming. We will explore how to use display variables to print output and understand the different ways to combine text and variables.

What are Display Variables?

Display variables are used to print output in Java. The `print()` method is often used to display variables, but it can also be used to print any type of data.

Combining Text and Variables

To combine text and variables, we use the `+` symbol. This symbol has two meanings:

- For text strings, it concatenates the strings together.
- For numbers, it adds the values together.

Example: Combining Text and Variables

```
```java
int age = 24;
String name = "Maharuf";
System.out.println("The name and age is " + name + " " + age);
```
```

In this example, we combine the text "The name and age is " with the `name` variable and the `age` variable using the `+` symbol.

Example: Adding Numbers

```
```java
int x = 10;
int y = 20;
System.out.println("The sum of x and y is " + x + y);
```
```

In this example, we add the values of `x` and `y` together using the `+` symbol.

Important Points to Note

-
- When combining text and numbers, be careful with the order of operations. Java will treat numbers as text after the first text string.
 - Use parentheses to ensure that operations are performed in the correct order.

Example: Using Parentheses

```
``java
int x = 10;
int y = 20;
System.out.println("The sum of x and y is " + (x + y));
``
```

In this example, we use parentheses to ensure that the addition operation is performed before the concatenation.

Key Takeaways

- Display variables are used to print output in Java.
- The `` symbol is used to combine text and variables.
- Be careful with the order of operations when combining text and numbers.
- Use parentheses to ensure that operations are performed in the correct order.

Conclusion

In this video, we learned about display variables and how to use them to print output in Java. We also explored how to combine text and variables using the `` symbol and how to use parentheses to ensure that operations are performed in the correct order. With practice and experience, you will become more comfortable using display variables and combining text and variables in your Java programs.
