

Introduction to Display Variables

=====

In this video, we will be discussing display variables, a fundamental concept in Java programming.

What are Display Variables?

Display variables are used to display the value of a variable. In Java, we use the `println` method to display the value of a variable.

How to Display Variables

To display a variable, we use the `println` method followed by the variable name. For example:

```
```java
int age = 24;
System.out.println(age);
```
```

This will display the value of the `age` variable, which is 24.

Combining Text and Variables

We can combine text and variables using the `+` operator. For example:

```
```java
String name = "Maharuf";
int age = 24;
System.out.println(name + " " + age);
```
```

This will display the text "Maharuf 24".

Important Points to Note

- When combining text and variables, the `+` operator is used for concatenation.
- When combining numbers, the `+` operator is used for addition.
- Be careful when combining text and numbers in the same line of code, as Java will treat the numbers as text after the first thing.

Examples

Example 1: Combining Text and Variables

```
```java
String name = "Maharuf";
int age = 24;
System.out.println(name + " " + age);
```
```

Output: Maharuf 24

Example 2: Combining Numbers

```
```java
int x = 10;
int y = 20;
System.out.println(x + y);
```
```

Output: 30

Example 3: Combining Text and Numbers

```
```java
int x = 10;
int y = 20;
System.out.println("The sum of x and y is " + x + y);
```
```

Output: The sum of x and y is 1020 (not 30, because Java treats the numbers as text after the first thing)

Key Takeaways

- Use the `println` method to display the value of a variable.
- Use the `+` operator to combine text and variables.
- Use the `+` operator to combine numbers.
- Be careful when combining text and numbers in the same line of code.

Conclusion

In this video, we learned about display variables and how to combine text and variables using the `+` operator. We also learned about the importance of being careful when combining text and numbers in the same line of code.
